Hazard Ratios for Risk of Revision Surgery

This large series of total wrist arthroplasties performed over a 40-year period demonstrates relatively poor long-term implant survival:

- 10-year implant survival rate: 74%
- 20-year implant survival rate: 63%

Improved Implant Survival: Inflammatory arthritis
Worse Implant Survival: Meuli and Universal implants

Lower Complications: Swanson and Remotion implants
Higher Complications: Meuli and Biax implants
